

# Basic fluorescence toolkit

# HW 4 posted

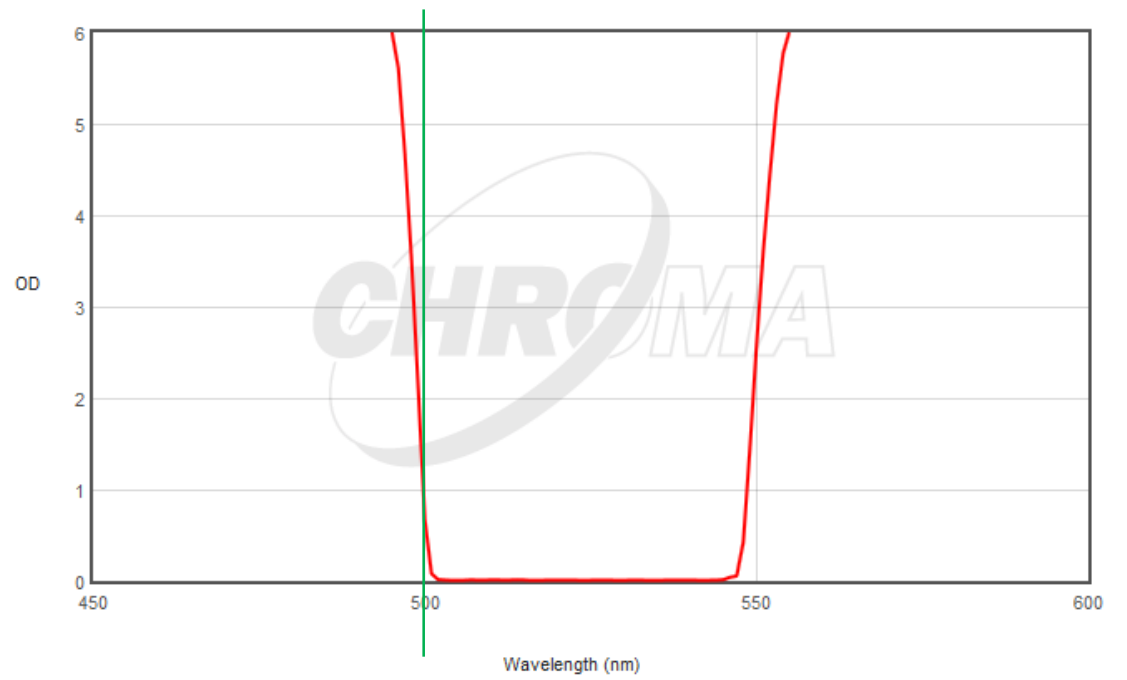

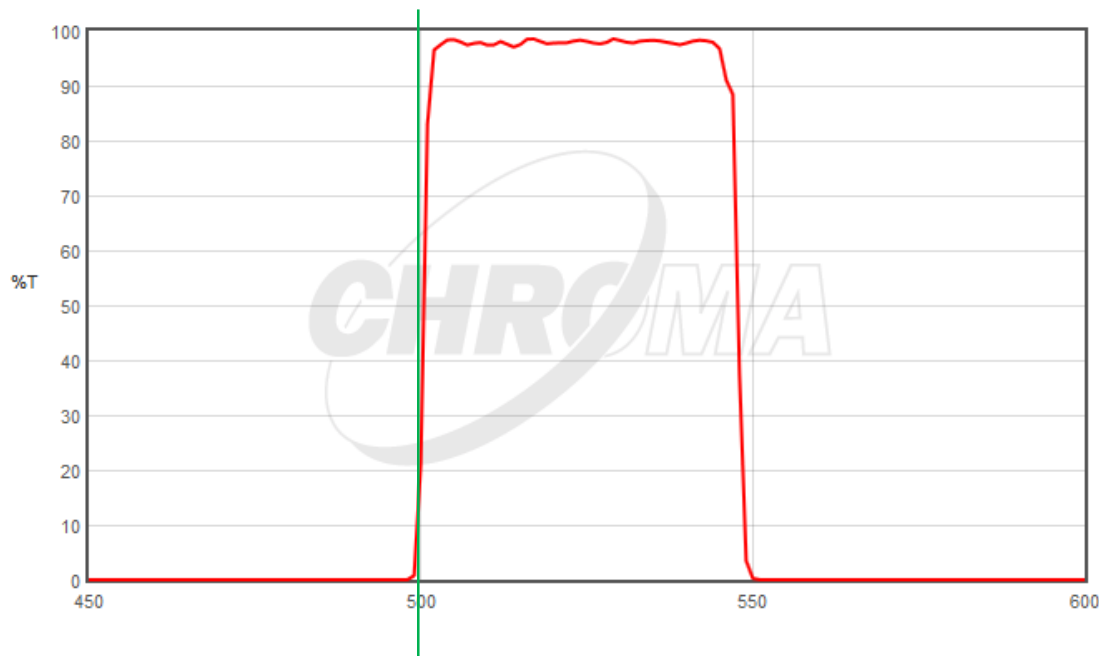

- Due next Fri (10/13)

- Last class
  - FPs
  - GFP/mCherry
  - Exotic fluorophores
  - Filters
- This class
  - Basic applications of fluorescence
  - Limitations
  - Quantitation

# OD vs % transmission

$$\text{OD} = -\log_{10}(\text{Transmission})$$

1 OD = 10% transmission, 2OD = 1% transmission, 3 OD = .1% transmission

# Photoactivatable and photoconvertible GFPs

- Initially dark – can be activated by fluorescence with UV light
- Initially green, can be converted to red with UV light
- Some will also photoconvert with time (Timers)

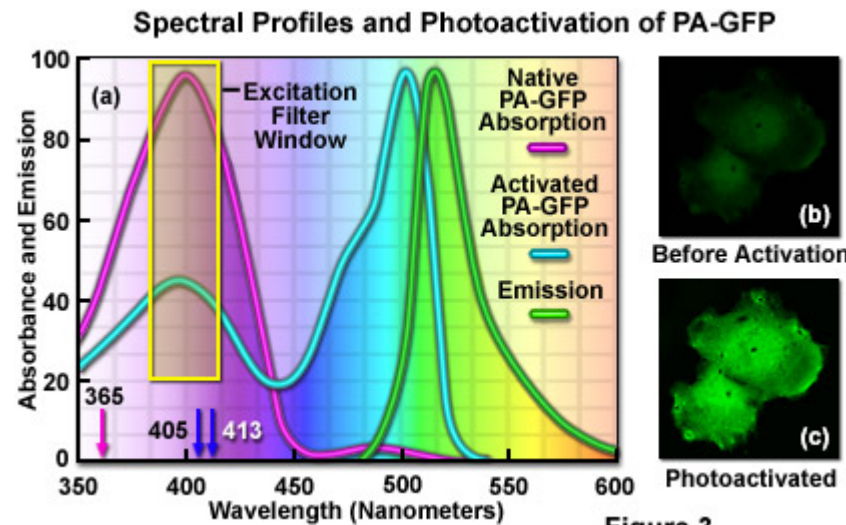

Figure 3

## Photoconversion Reactions in Optical Highlighters

Figure 1

# Basic Applications

- Cell labeling
- Molecule labeling
- Molecule interactions

# Cell labeling

- Put FP downstream of cell specific promoter

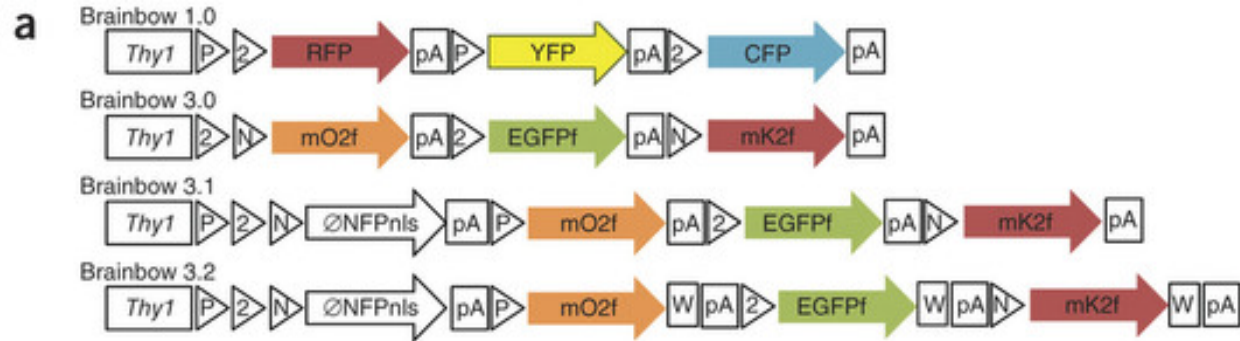

Table 1 - Promoters of tissue-specific expression of transgenes.

Promoter	Abbreviation	Cell type of highest activity	Reference
Neuron-specific enolase	NSE	Neurones	(112)
Tubulin $\alpha$ 1	T- $\alpha$ 1	Neurones	(113)
Glial-fibrillary acidic protein	GFAP	Astrocytes	(25,114,115)
Myosin light chain-2	MLC2	Cardiomyocytes	(116-118)
Preproendothelin-1	ET-1	Endothelial cells	(119)
Tie	tie	Endothelial cells	(120)
SM22 $\alpha$	SM22 $\alpha$	Vascular smooth muscle cells	(121)
$\alpha$ 1-Antitrypsin	$\alpha$ 1-AT	Hepatocytes	(91,122)
Albumin	ALB	Hepatocytes	(123)
Side-chain-cleavage enzyme	SCC	Steroidogenic cells	(124,125)
Kidney-androgen responsive protein	KAP	Renal proximal tubular cells	(126)

# Brainbow

- Used to resolve individual cells in very dense samples
- Use stochastic Cre recombination

# Organelle labeling

- Use targeting sequence
- Translated peptide before or after the FP

Structure	Targeting Gene/Tag	Fluorescent Protein	
Nucleus	NLS	EBFP2	<a href="#">pEBFP2-Nuc</a>
Nucleus	NLS	mKamala1	<a href="#">pmKalama1-Nuc</a>
Nucleus	NLS	mCherry	<a href="#">pQC NLS mCherry IX</a>
Nucleus	NLS	YFP	<a href="#">pQC NLS YFP IX</a>
Nucleus	H2A	mTurquoise2	<a href="#">pmTurquoise2-H2A</a>
Non-nucleus	Nuclear Export Sequence	mTurquoise2	<a href="#">pmTurquoise2-NES</a>
Mitochondria	ABCb10	GFP	<a href="#">pABCb10-GFP</a>
Mitochondria	COX8A(1-29)	mTurquoise2	<a href="#">pmTurquoise2-Mito</a>
Peroxisomes	Peroxisomal Targeting Sequence	mTurquoise2	<a href="#">pmTurquoise2-Peroxi</a>
Extracellular milieu	cfSGFP2-N	EGFP	<a href="#">cfSGFP2-N</a>
Membrane	palmitoylation sequence from GAP43	EGFP	<a href="#">pCAG-mGFP</a>
Membrane	palmitoylation sequence from p63	mTurquoise2	<a href="#">pPalmitoyl-mTurquoise2</a>
Periplasmic space	PelB signal sequence	YFP	<a href="#">pTDpelB-C_sfYFPTwinStrep</a>

# Protein labeling

- Can add it at the end of a protein sequence – get rid of stop codon, and add on the extra 700 AA.
- Can add localization signals
- Can put under a promoter to look at gene expression

Subcellular Localization of Fluorescent Protein Chimeras

# Immunohistochemistry

- Protein localization on fixed and permeabilized samples
- Can do membrane staining on live cells
- Necessary to buy antibodies with labels attached

# Antibody production

Figure 4-32 Essential Cell Biology, 2/e. (© 2004 Garland Science)

# Issues with immunohistochemistry

- Antibodies don't always do what the label says
- If you're basing a research project on antibody imaging, make sure it's targeting your protein of interest
- Non-specific targeting, incorrect targeting, batch to batch variability

Poorly characterized antibodies probably contribute more to the problem than any other laboratory tool, says Glenn Begley, chief scientific officer at TetraLogic Pharmaceuticals in Malvern, Pennsylvania, and author of a controversial analysis<sup>1</sup> showing that results in 47 of 53 landmark cancer research papers could not be reproduced.

## BAD ANTIBODIES

The most common problems with antibodies and how to avoid them.

### CROSS-REACTIVITY

**Problem:** An antibody is supposed to recognize only its target protein, but sometimes binds to others, depending on the proteins present in a sample.

**Solution:** An antibody should be tested for off-target binding using positive and negative controls.

### VARIABILITY

**Problem:** Separate batches of antibody can perform differently. This happens most often when the antibody is produced from a new set of animals.

**Solution:** Researchers should confirm lot numbers and characterization data with vendors.

### WRONG APPLICATION

**Problem:** Different experiments and experimental conditions can change a protein's folding and therefore its binding ability.

**Solution:** Scientists should check supplier's recommended applications.

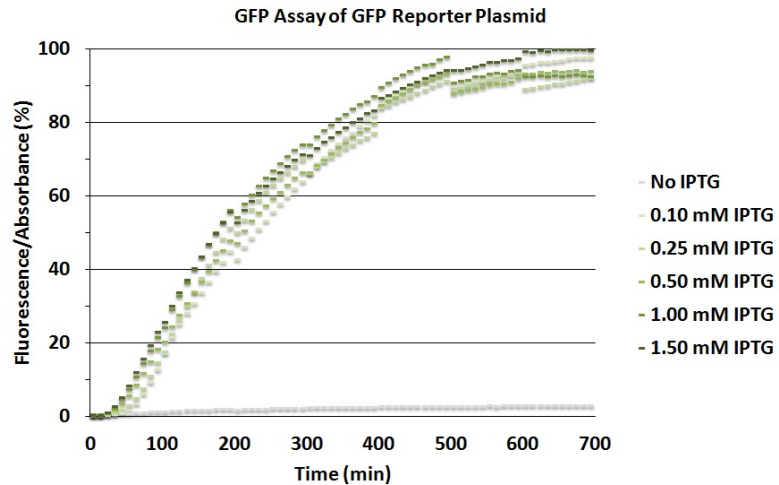

# Molecule tracking

# Gene expression

Representative images (10x) of GFP expression (green) in cortex, hippocampus, cerebellum, and cervical spinal cord from 6-week-old mouse which received a bilateral i.c.v. injection of AAV9 encoding the GFP transgene under the hSYN promoter c post-natal day 2. We observed that transgene expression was restricted to neurons throughout the CNS and PNS.

# FISH (Fluorescence *in situ* hybridization)

- Track nucleic acids in fixed cells

# Split GFP

11 Beta-barrel strands

**a**

**b**

**c**

# Limitations of fluorescent microscopy in biology

- Bleedthrough
- Autofluorescence
- Photobleaching\Phototoxicity
- Labeling
- Quantitation

# Resolution

- Always have to deal with the diffraction limit (though there are a few tricks)
- Typically on the order of 200-300 nm

Point-Spread Function

Diffraction limited spot

$$d = \frac{\lambda}{2NA}$$

Resolution limit

$$R = \frac{0.61\lambda}{NA}$$

# Autofluorescence

- NADPH, flavins
- Amino acids
- Chlorophyll!

Molecule	Excitation (nm)	Emission (nm)	Organisms	Reference
<a href="#">NAD(P)H</a>	340	450	All	[8]
<a href="#">Chlorophyll</a>	465, 665	673, 726	Plants	
<a href="#">Collagen</a>	270-370	305-450	Animals	[8]
<a href="#">Retinol</a>		500	Animals & bacteria	[9]
<a href="#">Riboflavin</a>		550	All	[9]
<a href="#">Cholecalciferol</a>		380-460	Animals	[9]
<a href="#">Folic acid</a>		450	All	[9]
<a href="#">Pyridoxine</a>		400	All	[9]
<a href="#">Tyrosine</a>	270	305	All	[2]
Dityrosine	325	400	Animals	[2]
Excimer-like aggregate	270	360	Animals	collagen[2]
Glycation adduct	370	450	Animals	[2]
<a href="#">Indolamine</a>			Animals	
<a href="#">Lipofuscin</a>	410-470	500-695	Eukaryotes	[10]
<a href="#">Polyphenol</a>			Plants	
<a href="#">Tryptophan</a>	280	300-350	All	
<a href="#">Flavin</a>	380-490	520-560	All	
<a href="#">Melanin</a>	340-400	360-560	Animals	[11]

# Fluorophore bleedthrough

- Fluorescence excitation and emission are broad
- Broad excitation tails will likely hit a bit of each fluorophore
- Can try to get around it with clever choice of excitation and emission filters

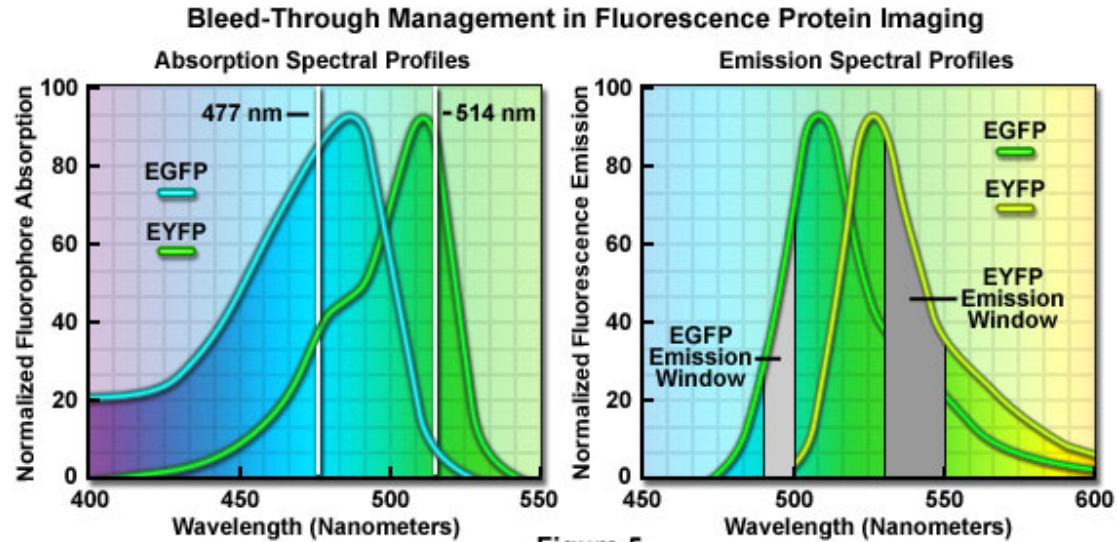

Figure 5

Figure 3

Allowable sets

CFP/YFP

GFP/mCherry

Cy3/Cy5

FITC/TRITC

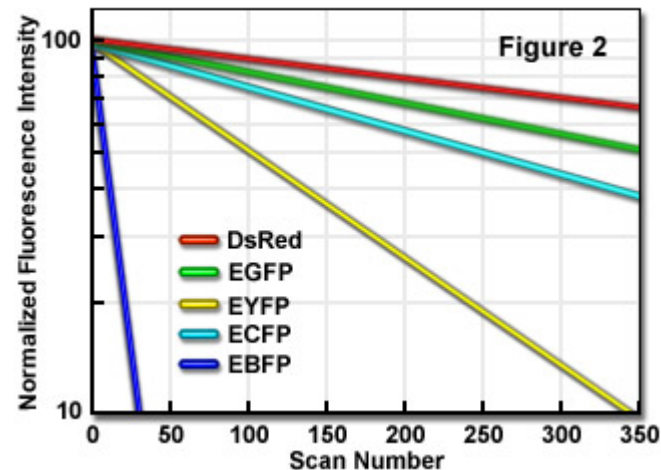

# Photostability and phototoxicity

- All fluorophores photobleach
- Autofluorescent molecules photobleach too
- Often generate free radicals
- Toxic to cells!
- “Dim” exposure to light can trigger

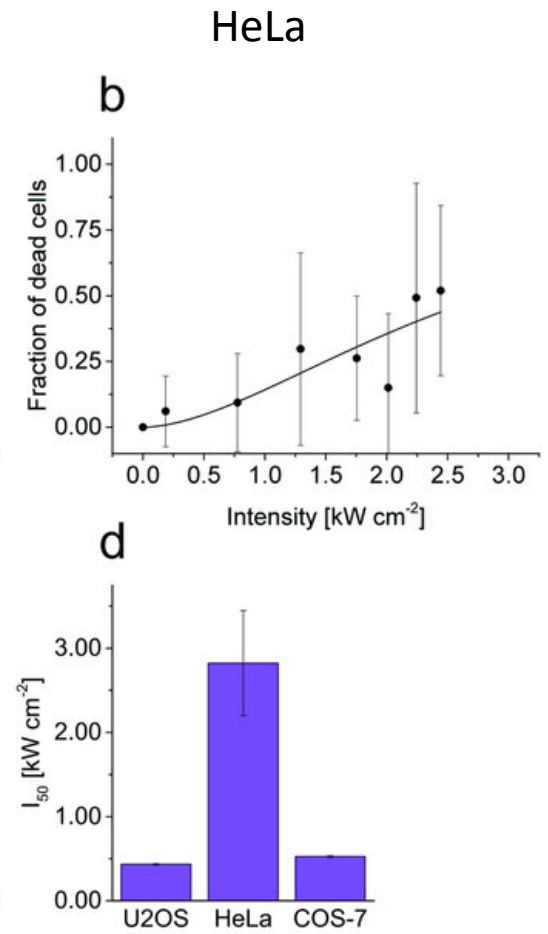

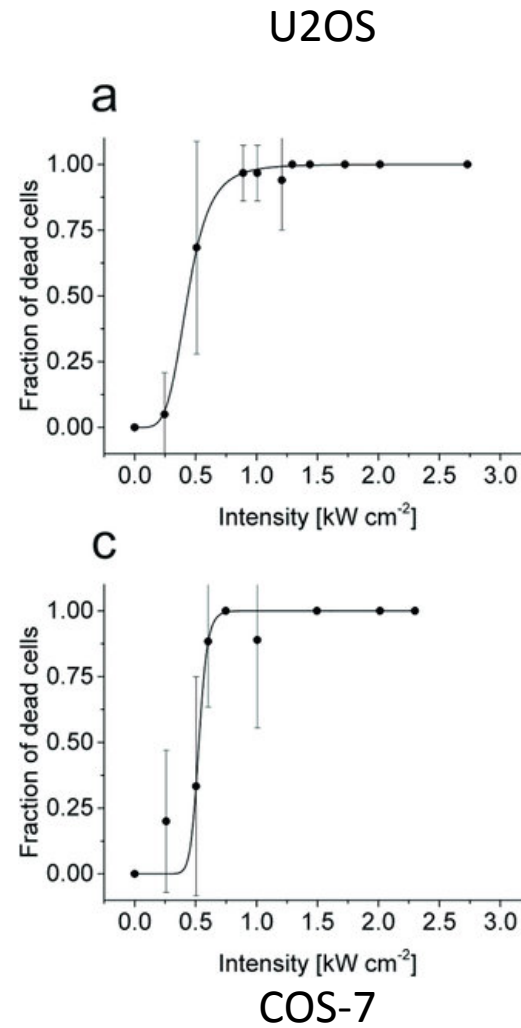

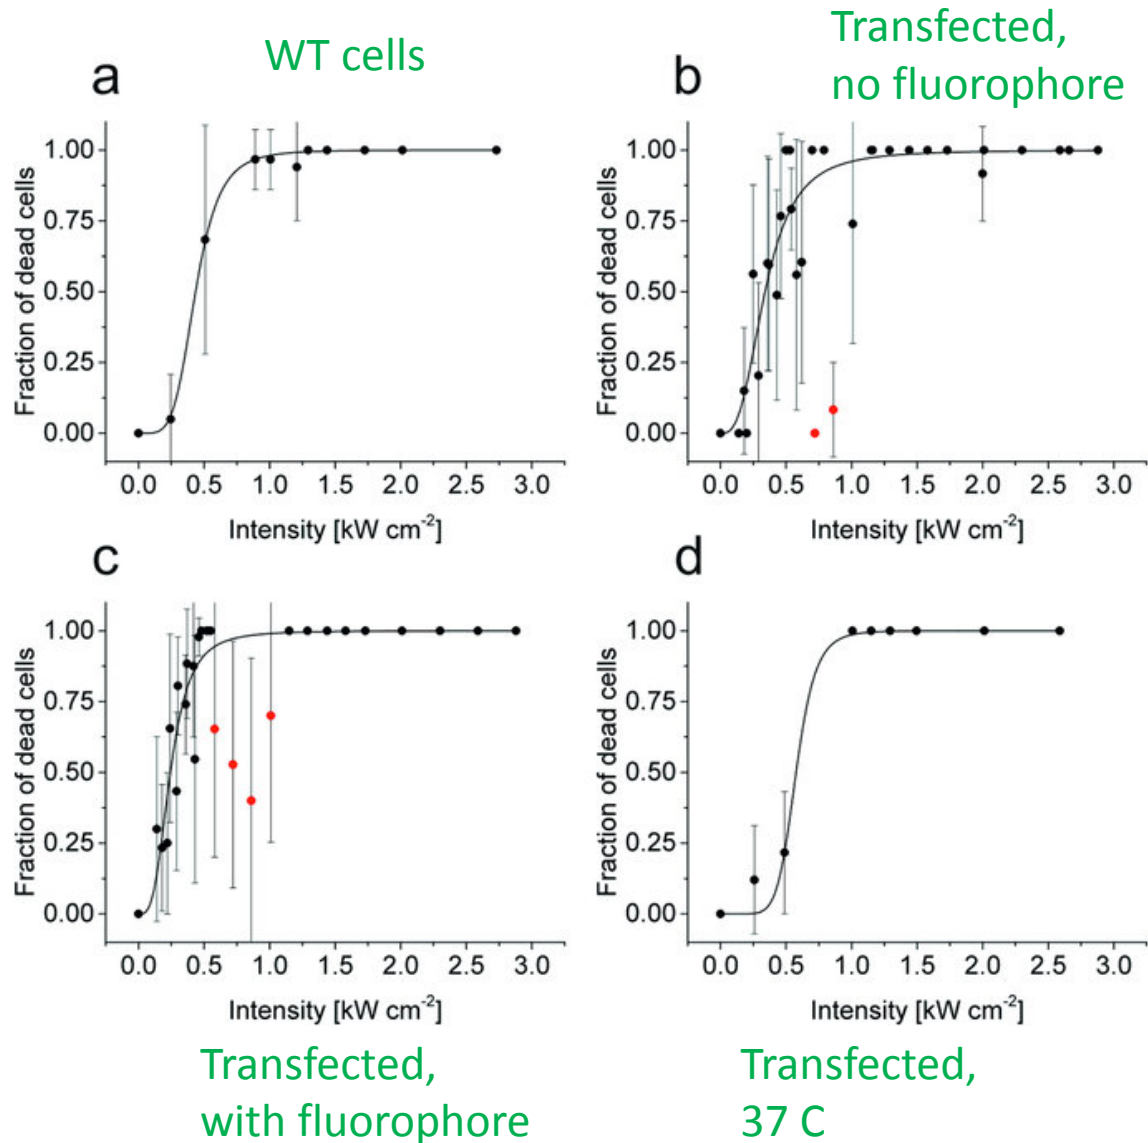

Yeast feel visible light at sunlight intensities

Fluorescent Protein Photobleaching Properties

Time-lapse acquisition of HeLa cells expressing GFP tagged histone-2B. The transmitted light and fluorescence images were simultaneously acquired in the absence (A) or presence (B) of CLEM.

# Quantitative phototoxicity

And on to Matlab...
